**Annuity Vocabulary**

Fixed vs. Variable

Retirement Researcher

Not for Distribution

# Fixed Annuities

Principal protection  
Insurance company general account  
Growth can be variable, but not negative

Not for Distribution

# Variable Annuities

Subject to losses  
Either investment-styled subaccounts  
Or RILAs

Not for Distribution

# **Annuity Vocabulary**

Immediate vs. Deferred

Retirement Researcher

Not for Distribution

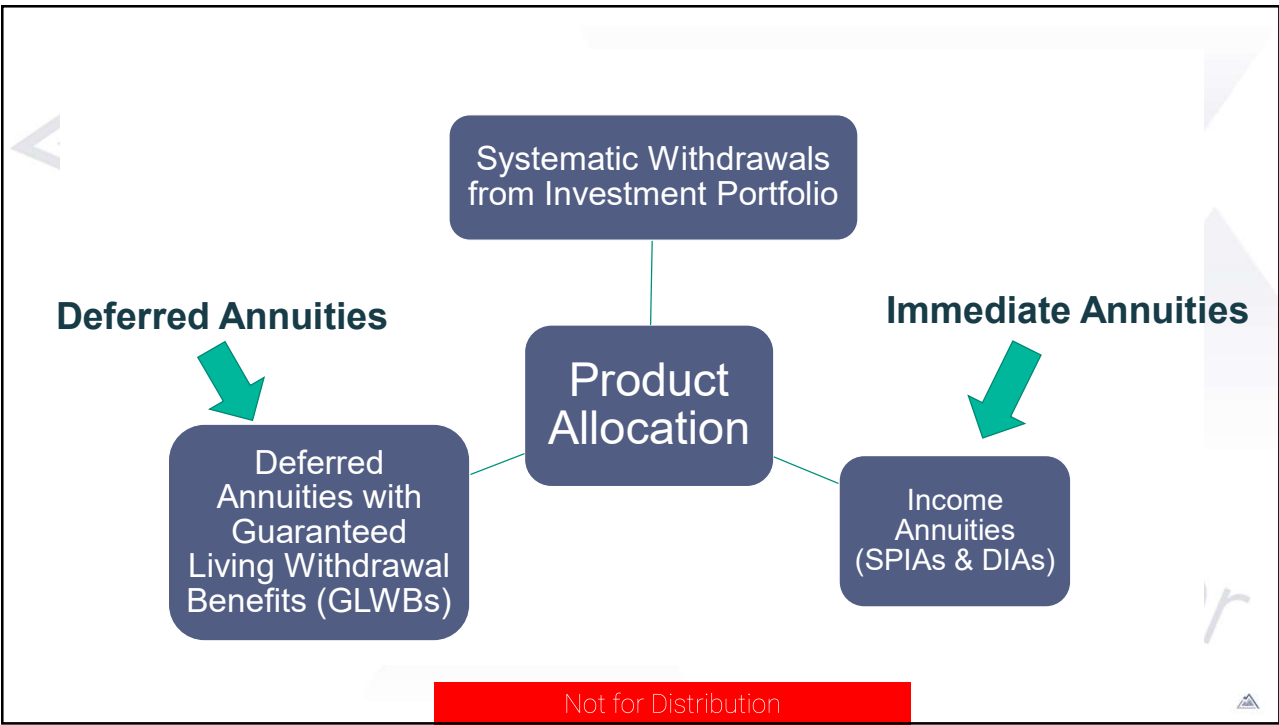

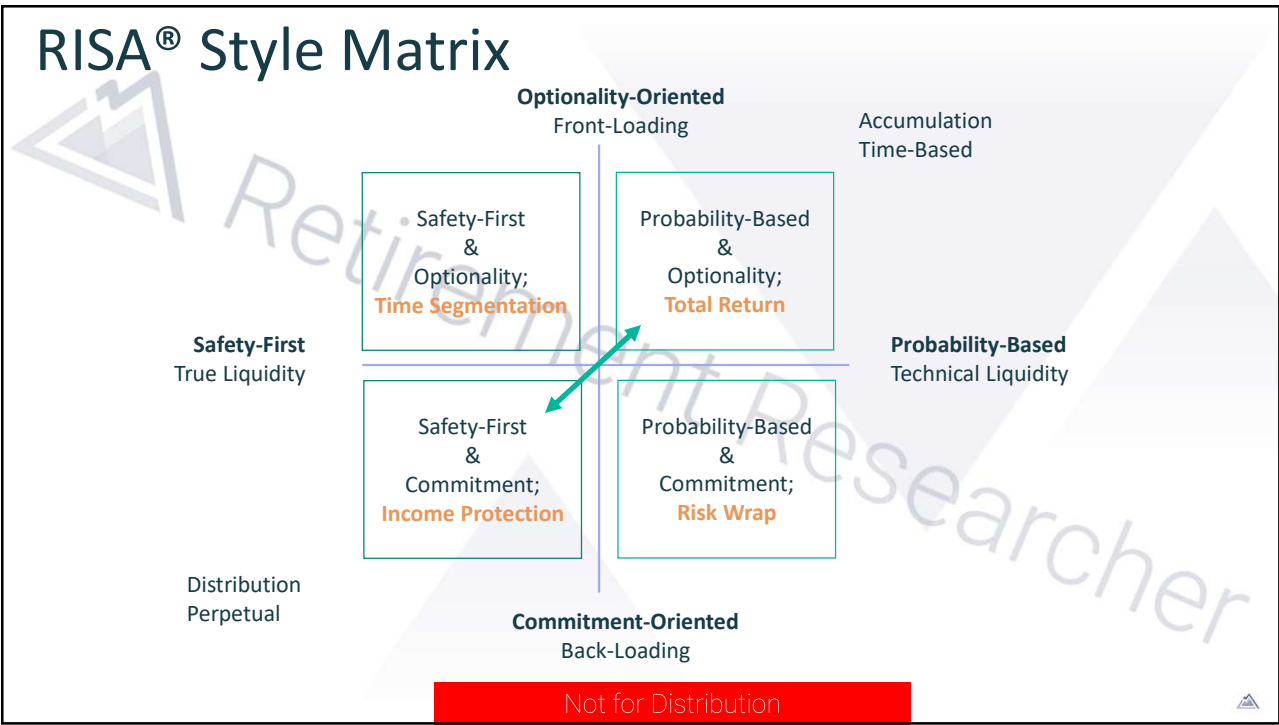

# Immediate vs. Deferred

When is contract annuitized?

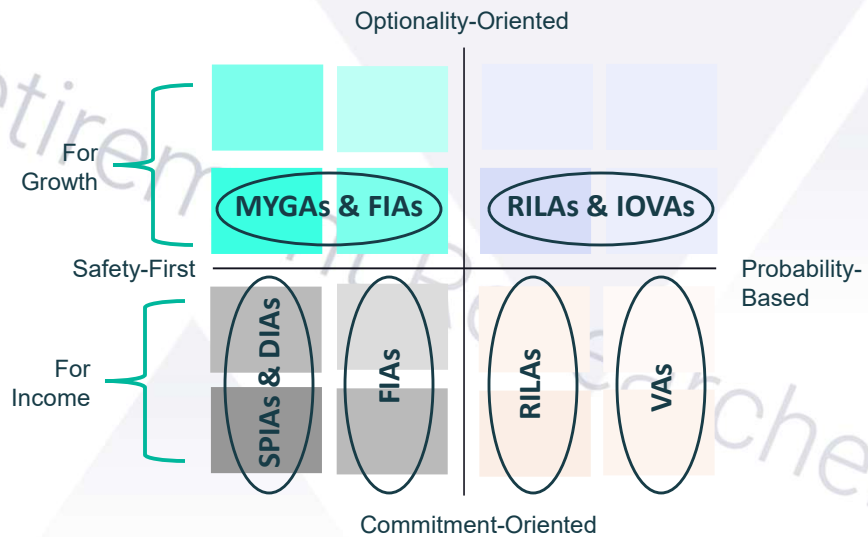

When do lifetime payments begin?

## Income Annuities (SPIAs and DIAs)

- *Who is covered by an annuity?*  
owner, annuitant, beneficiary
- *When do income payments start?*  
immediate or deferred
- *Do income annuities cover one life or two?*
- *What are the different flavors of payouts?*  
Life only, life with period certain, life with cash refund, life with installment refund, period certain (not linked to mortality)
- *Are payments fixed or do they grow over time?*  
Level payments, cost-of-living adjustments, inflation-indexed (CPI)

Not for Distribution

## Pricing an Income Annuity

- 1) Mortality rates (which vary by age and gender) impact how long payments will be made.
- 2) Interest rates impact the returns the annuity provider can earn on the underlying annuitized assets.
- 3) Overhead costs relate to extra charges an annuity provider seeks to cover business expenses and to manage risks related to the accuracy of their future mortality and interest rate predictions.

## Other Income Annuity Pricing Dynamics

Reduced payment for:

- 1) Increased certainty of payments (period certain, cash refund)
- 2) Joint life instead of single life
- 3) Cost-of-living adjustments on payments

Not for Distribution

## **Income Annuities & Investment Returns**

Payout rate  $\neq$  Rate of return

Includes return of principal  
Comparable to “4% rule” style withdrawal rates

Not for Distribution

## Income Annuities & Investment Returns

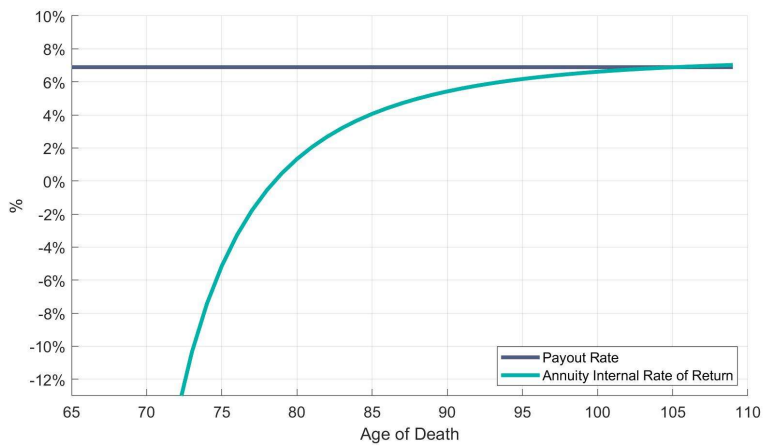

Payout rate includes an underlying return assumption linked to performance of insurance company's general account

- ❖ Primarily fixed income
- ❖ Asset-liability matching
- ❖ Higher fixed income yields than households might earn – longer maturity, more diversified credit risk, less need for liquidity, institutional pricing on trades

## Deferred Income Annuities

Including a deferral period for an income annuity increases the payout rate for two reasons:

- 1) Reduced probability of survival for receiving payments
- 2) Opportunity for investment growth on premiums in insurance company's general account

## Income Annuities

|                                 |   |
|---------------------------------|---|
| Income guaranteed amount        | What is the minimum guaranteed amount of lifetime income?   |
| Guaranteed withdrawal rates     | What is the guaranteed payout rate? How does it vary by age and length of deferral period?                  |
| Other withdrawal features       | Does the contract provide liquidity to take nonguaranteed withdrawals? (Answering yes is uncommon)          |
| Death benefit                   | What are the death benefit provisions, such as cash refund, installment refund, or period certain payments? |
| Insurance company credit rating | What credit ratings has the insurance company earned from the major credit rating agencies?                 |

Not for Distribution

**Fixed  
Index  
Annuities**

Retirement Researcher

Not for Distribution

## Fixed Index Annuity – General Features

- Principal protection for contract value
- *Some* degree of upside potential
- Liquidity – contract is not annuitized
- Tax deferral
- Lifetime spending protection through optional guaranteed lifetime withdrawal benefit (GLWB)

Not for Distribution

## Fixed Index Annuity – Behavioral Aspects

- Obtain risk pooling without “sacrificing” asset
- Can still see assets on the balance sheet
- Principal protection – not at risk of loss  
-> more investing comfort elsewhere

Not for Distribution

# Crediting Method

FIA “returns” = **interest crediting**

Fixed interest or  
linked to external index performance

Ex. S&P 500, MSCI EAFE, Low-Volatility Index

Not for Distribution

## Linked Index

FIAs **do not** invest in the index

Interest is based index performance  
through **financial derivatives**

This means price returns **without** dividends!

Not for Distribution

# Principal Protection

FIA's are fixed annuities

Contract value does **not** decrease  
when index experiences losses

Not for Distribution

## Fixed Index Annuity Fees

- ~~1. Underlying fund expenses~~
  - ~~2. Mortality and expense charges~~
  3. Surrender charges (for excess distributions in early contract years)
  4. Charges for optional living benefits (i.e. the GLWB) or death benefits
  5. Unobserved internal spread  
(like a single-premium immediate annuity)
- } “no fees”

New fee-only annuities:  
do not pay commissions, which can reduce (3) and (5)

Not for Distribution

## One-year Term Point-to-Point Crediting Method with Annual Reset

- Most common method (more competition on pricing)
- One-year: length of term; could be longer
- Point-to-point: compare value of market index at the start and end of year/term
- Credit interest for the year based on index price return (excluding dividends)
- Annual reset: Comparisons start fresh for each term – no need for cumulative gains to make up for previous losses

Not for Distribution

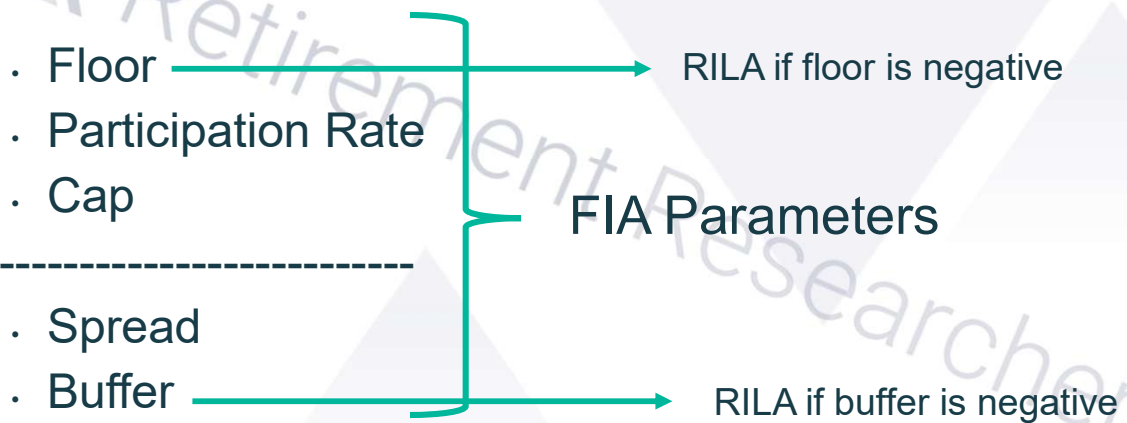

## Basic idea – FIA Interest Crediting

1. Buy enough bonds to protect principal after interest is received
2. From remainder, keep enough to cover company expenses (i.e. internal fees)
3. Use remaining funds to purchase financial derivatives (call options) providing upside exposure to linked index

Not for Distribution

## Crediting Interest -- Translating Price Return into FIA "Return"

Not for Distribution

## FIA Parameters Depend on...

Level of **interest rates**

How much is needed for principal protection?

What is the options budget?

Cost of **financial derivatives**

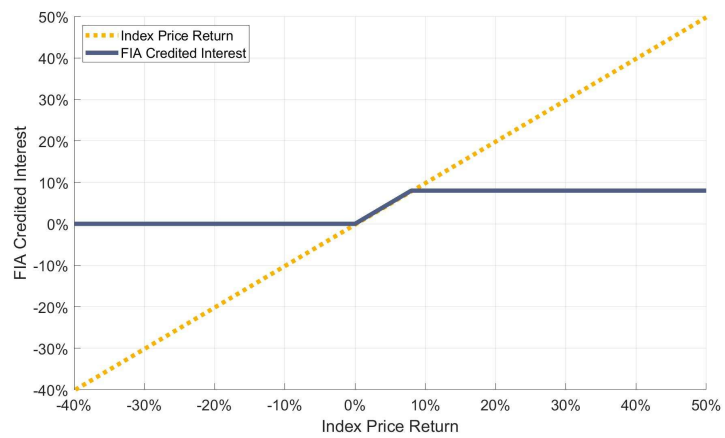

Not for Distribution

## Factors for Options Pricing

| Factor                                       | Impact of Increase on Call Option Price  |
|--|--|
| Implied Volatility                           | Increased volatility = more expensive option;<br>most important factor                         |
| Current Index Price &<br>Option Strike Price | Increased Strike Price = less payoff potential<br>= cheaper option                             |
| Risk-Free Interest Rate                      | Increased interest rate = slight increase in<br>price (though offset by larger options budget) |
| Term to Maturity                             | Increased term = more expensive option<br>(but not linear)                                     |

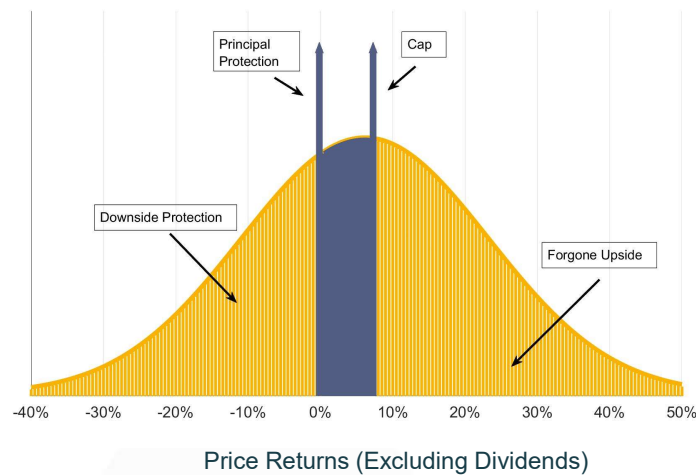

Not for Distribution

## Fixed Index Annuity Credited Interest, based on Index Price Return and 8% Cap

Not for Distribution

## Annual Return Distribution for a Fixed Index Annuity with a 1-Year Term & 8% Cap

# Parameter Renewals for Each Term

Same process each term for insurance company

Buy bonds to protect principal  
and buy derivatives for upside

Degree of upside depends on interest rates and option  
pricing factors – conditions change

Not for Distribution

## Parameter Renewals for Each Term

Insurance companies must maintain the right to change parameters each term

Good companies will not take advantage of this  
(recommendation: examine renewal history)

Especially during the surrender charge period

Not for Distribution

## What is the best crediting method?

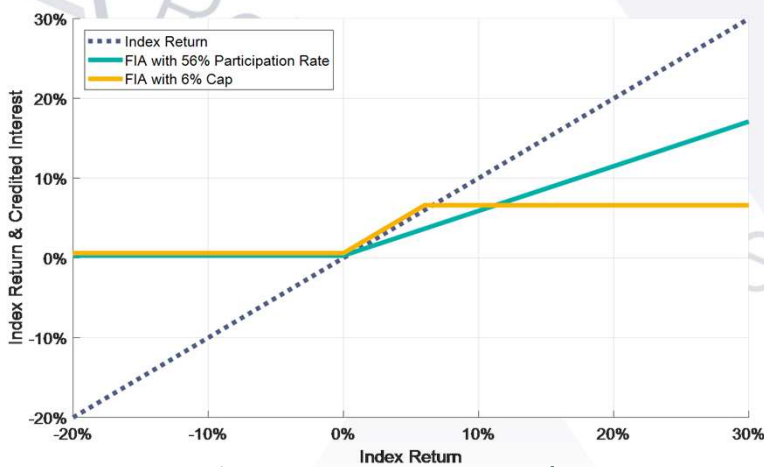

Once index returns are known, one method will perform best

But with competitive pricing,  
the choice of crediting method should not matter  
(can't predict market returns)

Most important: how has the company treated its customers?

Not for Distribution

# Comparing Crediting Methods: Cap Rate vs. Participation Rate

Participation Rate: 56%

Cap Rate: 6%

Cap rate is better for index price return between 0% and 10.7%.  
Participation rate is better if price return > 10.7%

For illustration purposes only. Does not represent any specific investment.

Not for Distribution

## Longer Term Length

- (+) Current parameters locked in for longer
- (+) More upside from financial derivatives
- (-) No interest credited until term end

Not for Distribution

**Registered  
Index-Linked  
Annuities**

**Annuities as Accumulation Tools**

Retirement Researcher

Not for Distribution

## Accumulation without income protections

- Multi-year Guaranteed Annuities (MYGAs) / Deferred Fixed Annuities (DFAs)
- Fixed Index Annuities (FIAs)
- Registered Index-Linked Annuities (RILAs)
- Variable Annuity with guaranteed minimum accumulation benefit
- Investment-only Variable Annuities (IOVAs)

Not for Distribution

## MYGAs or DFAs as an “Asset Class”

- Principal is protected from investment volatility
- Assets grow at a higher yield than Treasuries
- Diversified asset base with less credit risk
- Tax deferral
- Potential early withdrawal penalties

only. Not for use with the public.  
Not for Distribution

## **FIA as an “Asset Class”**

FIA for accumulation without living benefits:  
Principal protection  
Competitive with bonds net of taxes  
Not a stock replacement

Not for Distribution

## RILA as an “Asset Class”

RILA for accumulation without living benefits:

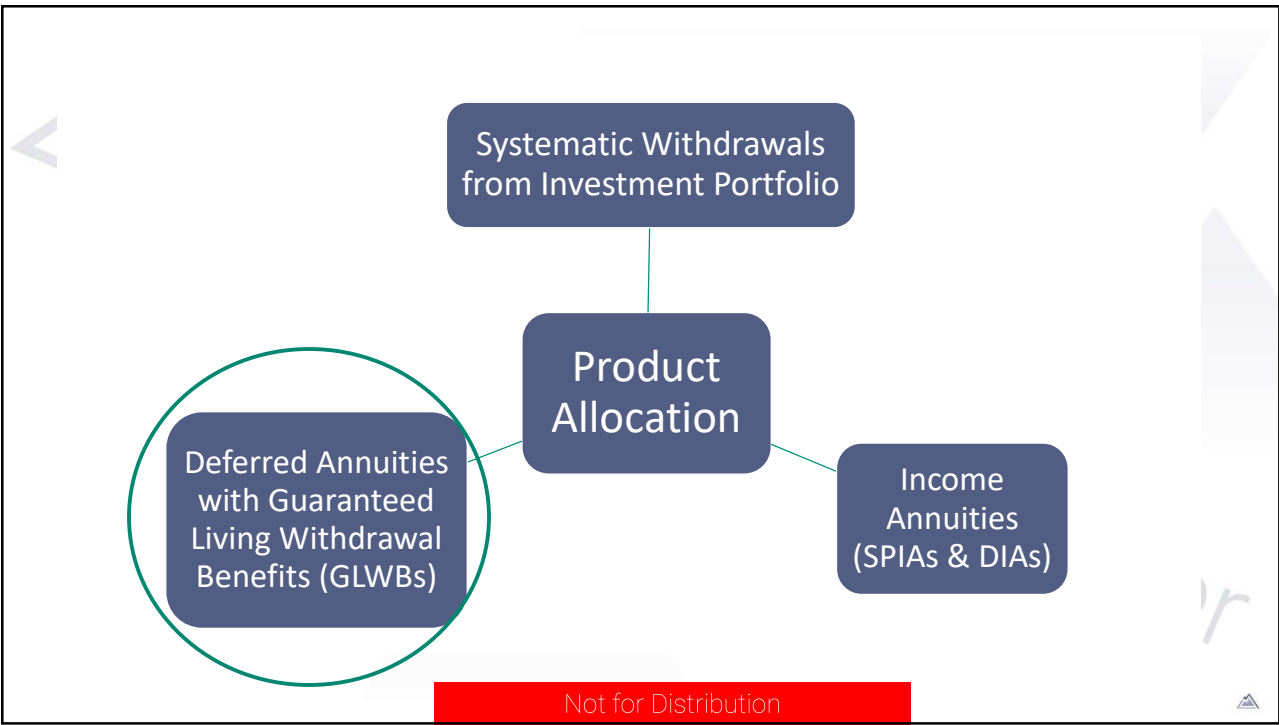

- Limits on upside potential
- More upside exposure than FIAs
- May draw from stocks & bonds

For illustration purposes only. Does not represent any specific investment.

Not for Distribution

**“In the Money”**

Contract value  
is less than benefit base

Increases the value of the GLWB

Not for Distribution

## Step-up Opportunities

New high watermarks

Could be less common for FIAs  
(Especially if cap rate is less than rollup or distribution rate)

Thus, focus on guaranteed income

Not for Distribution

## Guaranteed Withdrawal Amount (Deferral Credits instead of Roll-Up Rate)

### Withdrawal Rate x Benefit Base

Age at contract issue + deferral credit x length of deferral

Ex. 4.5% payout at issue; increases by 0.3% for each deferral year (i.e. 7.5% after 10 years)

Provides an alternative to using rollup rate  
Step-ups are still possible (they may not be likely)

Not for Distribution

## Guaranteed Withdrawal Rates: GLWB vs. SPIA

For illustration purposes only. Does not represent any specific investment.

Not for Distribution

# Guaranteed Withdrawal Amount

FIA with GLWBs  
can be **competitive** with SPIAs

Not for Distribution

## **GLWB and Deferred Annuitization**

Annuity owner is spending own money until  
contract value depletes

Insurance company is only on the hook  
for the guarantee after account depletion

Not for Distribution

## A Summary of Annuities

- ❑ For retirees who view annuities as a bond replacement and whose overall spending goal implies a lower withdrawal rate than the annuity payout rate, partial annuity strategies can:
  - Increase success rates
  - Protect more of lifetime spending goals
  - Improve legacy outcomes especially beyond life expectancy
- ❑ The longevity credits provided through risk pooling provide relief for the distribution needs from non-annuity assets, giving them more potential to grow.
- ❑ But not everyone will need or want an annuity.
  - Some retirees may already have plenty of lifetime annuity income through Social Security and traditional pensions.
  - Others will prefer the optionality and growth potential of investments.

Not for Distribution

## Assess whether your characteristics and preferences are aligned with annuities

- ❑ Your RISA Profile suggests that your preferences align with income protection and risk wrap strategies.
- ❑ You have an income gap in which there is not enough reliable income to cover your longevity expenses.
- ❑ Your risk tolerance limits your comfort with stocks in retirement. The case for annuities is stronger for those with a lower stock allocation.
- ❑ You have greater longevity risk aversion. Concerns about outliving retirement assets lead to more relative benefits from annuities as the alternative is to spend even less from investments.
- ❑ You view annuities as a replacement for bonds and are comfortable using a higher stock allocation with remaining investment assets.
- ❑ You seek protection from making behavioral mistakes with your investment portfolio, you lack self-control for spending, or you find investments intimidating. Annuities may also protect less financially savvy family members.

Not for Distribution

## Learn about the features and mechanics of different annuities

- ❑ When comparing annuities for lifetime income, first focus on the minimum guaranteed withdrawals for your purchase age and anticipated income starting age.
- ❑ Consider your preferences for tradeoffs between upside and downside, the desire for liquidity, and the types of asset allocations you would use both with and without income protections.
- ❑ Determine whether there may be an annuity option with other attractive features that make it worth accepting even if it does not have the strongest downside guarantees.

Not for Distribution

## Learn about the features and mechanics of different annuities

- Determine the income gap you are seeking to fill and decide whether the amount of assets needed to fill that gap with annuities is reasonable. Decide on a premium amount.

Not for Distribution

## Take your time with the purchase decision

- ❑ Discuss the decision with family members to coordinate both with the spouse/partner and with any potential heirs.
- ❑ Work with someone who is familiar with the vast array of available annuities and understands which work better for different purposes, ages, and deferral periods.
- ❑ Make sure you understand how the annuity works with respect to its various features and fees.
- ❑ Only add living or death benefits that you intend to use.
- ❑ Consider diversifying purchases between different companies and even different types of annuities.
